Contents, Volume 23

Number 1 **February 1989**

MARTIN DESROCHERS AND FRANÇOIS SOUMIS—A Column Generation Approach to the Urban Transit Crew Scheduling Problem 1

DUŠAN TEODOROVIĆ AND EMINA KRČMAR-NOŽIĆ—Multicriteria Model to Determine Flight Frequencies on an Airline Network under Competitive Conditions 14

RAJAN BATTA, ANJAN GHOSE AND UDATTA S. PALEKAR—Locating Facilities on the Manhattan Metric with Arbitrarily Shaped Barriers and Convex Forbidden Regions 26

RANDOLPH W. HALL—Graphical Interpretation of the TransportationProblems 37

P. W. G. NEWMAN, B. ALIMORADIAN AND T. J. LYONS—Estimating Fleet Fuel Consumption for Vans and Small Trucks 46

Technical Notes

ZVI DREZNER—Conditional p-Center Problems 51

ODED BERMAN AND DAVID SIMCHI-LEVI—The Traveling Salesman Location Problem on Stochastic Networks 54

Bibliographic Section 58

Number 2 **May 1989**

T. WILLIAM CHIEN, ANANTARAM BALAKRISHNAN AND RICHARD T. WONG—An Integrated Inventory Allocation and Vehicle Routing Problem 67

NANCY L. NIHAN AND GARY A. DAVIS—Application of Prediction-Error Minimization and Maximum Likelihood to Estimate Intersection O-D Matrices from Traffic Counts 77

MARK S. DASKIN AND NICHOLAOS D. PANAYOTOPOULOS—A Lagrangian Relaxation Approach to Assigning Aircraft to Routes in Hub and Spoke Networks 91

R. H. KIMBER—Gap-Acceptance and Empiricism in Capacity Prediction 100

PHILIP C. JONES AND ERIC S. THEISE—On the Equivalence of Competitive Transportation Markets and Congestion in Spatial Price Equilibrium Models 112

STELLA DAFERMOS AND ANNA NAGURNEY—Supply and Demand Equilibration Algorithms for a Class of Market Equilibrium Problems 118

MARGUERITE FRANK—The Equilibrium Worth of a Network Link 125

Technical Notes

J. N. HOOKER AND R. S. GARFINKEL—On the Vector Assignment p-Median Problem 139

MOSHE DROR AND PIERRE TRUDEAU—Savings by Split Delivery Routing 141

Bibliographic Section 149

Number 3 **August 1989**

SERGIO R. JARA-DÍAZ AND PEDRO P. DONOSO—On the Bias Caused by Spatial Aggregation of Flows on the Estimation of the Degree of Scale Economies 151

FEDERICO SABRIA AND CARLOS F. DAGANZO—Approximate Expressions for Queueing Systems with Scheduled Arrivals and Established Service Order 159

MOSHE DROR, GILBERT LAPORTE AND PIERRE TRUDEAU—Vehicle Routing with Stochastic Demands: Properties and Solution Frameworks 166

JULIAN BENJAMIN—An Analysis of Inventory and Transportation Costs in a Constrained Network 177

DIMITRIS J. BERTSIMAS—Traveling Salesman Facility Location Problems 184

CHARLES REVELLE AND KATHLEEN HOGAN—The Maximum Availability Location Problem 192

ZVI DREZNER AND GEORGE O. WESOLOWSKY—The Asymmetric Distance Location Problem 201

Technical Notes

JOHN R. CURRENT AND DAVID A. SCHILLING—The Covering Salesman Problem 208

I. DOUGLAS MOON—Maximin Center of Pendant Vertices in a Tree Network 213

REX K. KINCAID AND ODED Z. MAIMON—Locating a Point of Minimum Variance on Triangular Graphs 216

J. N. PRASHKER AND D. MAHALEL—The Dispersion of the Stopping Probability Function 219

Bibliographic Section 224

Number 4 **November 1989**

WARREN B. POWELL—A Review of Sensitivity Results for Linear Networks and a New Approximation to Reduce the Effects of Degeneracy 231

ANDRÉ DE PALMA, VICTOR GINSBURGH, MARTINE LABBÉ AND JACQUES-FRANÇOIS THISSE—Competitive Location with Random Utilities 244

WAGNER A. KAMAKURA—The Estimation of Multinomial Probit Models: A New Calibration Algorithm 253

ANASTASSIOS N. PERAKIS AND NIKIFOROS A. PAPADAKIS—Minimal Time Vessel Routing in a Time-Dependent Environment 266

RAJAN BATTA, JUNE M. DOLAN AND NIRUP N. KRISNAMURTHY—The Maximal Expected Covering Location Problem: Revisited 277

VICKI AARONSON HUTSON AND CHARLES S. REVELLE—Maximal Direct Covering Tree Problems 288

Bibliographic Section 300

Subject Index

A

Aircraft, assignment, use of Lagrangian relaxation, 91–99
Airline network, multicriteria model to determine flight frequencies on, 14–25
Algorithm
  aircraft assignment routes, 91–99
  asymmetric rectilinear minimax problem, 201–207
  conditional *p*-center problems, 51–53
  demand market (consumer) equilibrium, 118–124
  estimation of multinomial probit models, 253–265
  flow augmenting paths, 231–243
  intersection O-D matrices from traffic counts, 77–90
  minimal time routing, 266–276
  minimum variance on triangular graphs, 216–219
  pendant vertices in tree network, 213–216
  split delivery routing, 141–145
  supply and demand equilibrium, 118–124
Allocation and routing problem, integrated, 67–76
Assignment *p*-median problem, 139–140
Asymmetric distance location problem, 201–207

B

Backhauls, transportation problem, 37–45
Bias caused by spatial aggregation of flows, estimation of degree of scale economies, 151–158
Bibliographic section, 58–65, 146–149, 224–229, 300–303
Bus crew scheduling, 1–13

C

Column generation approach to urban transit crew scheduling, 1–13
Competition and congestion in equilibrium models, 112–117
Competitive location with random utilities, 244–252
Computational results
  maximum availability location problem, 192–200
  minimal time routing, 266–276
  split delivery routing, 141–145
Conditional *p*-center problems, 51–53
Cost
  constrained network, analysis of, 177–183
  spatial aggregation of flows, 151–158
Covering location problem, maximal expected, revisited, 277–287
Covering salesman problem, 208–213
Crew scheduling
  urban transit, column generation approach to problem of, 1–13

D

Delivery routing, savings by split, 141–145
Diesel trucks, fuel consumption, estimating, 46–50

E

Economies, spatial aggregation of flows, 151–158
Equilibrium
  models, competition and congestion in, 112–117
  worth, network link, 125–138
Estimation, multinomial probit models, 253–265
Euclidean distance, 37–45
  asymmetric, 201–207

F

Fleet fuel consumption, vans and small trucks, estimating, 46–50
Flight frequencies on airline network, multicriteria model to determine, under competitive conditions, 14–25
Fuel consumption, vans and small trucks, estimating, 46–50

G

Gap-acceptance and empiricism in capacity prediction, 100–111
Graphical interpretation of transportation problem, 37–45
Gumbel variables, queueing systems, 159–165

H

Heuristics, covering salesman problem, 208–213
Hub and spoke networks, aircraft routes, Lagrangian relaxation assigning, 91–99

I

Intersection O-D matrices, traffic counts, estimate, 77–90
Inventory
  allocation subproblem, 67–76
  costs, constrained network, 177–183

L

Lagrangian relaxation, assigning aircraft to routes in hub and spoke networks, 91–99
Lagrangian-based heuristic, 67–76
Link-utilization patterns, prediction, 125–138
Location problem
  asymmetric distance, 201–207
  barriers and forbidden regions with, 26–36
  competitive, with random utilities, 244–252
  maximum availability, 192–200

M

Manhattan travel metric, 26–36
Maximal direct covering tree problems, 288–299
Maximal expected covering location problem, revisited, 277–287
Maximin center, pendant vertices in tree network, 213–216
Maximum availability location problem, 192–200
Mendell-Elston's extension to multivariate normal, 253–265
Minimal spanning tree, 288–299
  problem, 288–299
Minimum variance, locating point, on triangular graphs, 216–219
Mixed integer programming formulation, 67–76
Model
  bus crew scheduling by column generation, 1–13
  competitive location with random utilities, 244–252
  fleet fuel consumption, 46–50
  gap-acceptance and empiricism, traffic junctions, 110–111
  global competitive transportation market, 112–117
  hybrid of local and global transportation markets, 112–117
  hypercube queueing, 277–287
  local competitive transportation markets, 112–117
  Manhattan location travel metric, 26–36
  market equilibrium, 118–124
  Markov decision process, 166–176
  multicriteria for flight frequencies on airline network, 14–25
  scheduled arrivals in queueing systems, 159–165
  spatial aggregation of traffic flows, 151–158
  stopping probability function, 219–223
  symmetric equilibrium, 125–138
  vehicle routing problem, 166–176
Multinomial probit models, estimation of, 253–265

N

Network
  constrained, analysis of inventory and transportation costs in, 177–183
  degeneracy, 231–243

linear, review of sensitivity results for, and new approximation to reduce effects of degeneracy, 231–243
link, equilibrium worth of, 125–138
Nonlinear costs, transportation problem, 37–45

P

p-Center problems, conditional, 51–53
p-Median problem
vector assignment, 139–140
with arbitrarily shaped barriers, 26–36
Pearson's approximation, 253–265
Pendant vertices, maximin center of, in tree network, 213–216
Prediction-error minimization, application, and maximum likelihood to estimate intersection O-D matrices from traffic counts, 77–90

Q

Queueing systems, approximate expressions for, with scheduled arrivals and established service order, 159–165

R

Random utilities, competitive location with, 244–252
Roundabouts, traffic junctions, 100–111
Routing
allocation problem and, integrated, 67–76
minimal time, vessel, 266–276
vehicle, with stochastic demands, 166–176

S

Scheduled arrivals and established service order, queueing systems, 159–165
Sensitivity results for linear networks, 231–243
Stochastic networks, traveling salesman location problem, 54–57
Stochastic queue median problem with arbitrarily shaped barriers, 26–36
Stopping probability function, dispersion of, 219–223

T

Time routing, minimal, in time-dependent domain, 266–276
Traffic
counts, intersection O-D matrices from, minimization and maximum likelihood estimation, 77–90
junctions, gap-acceptance and empiricism in capacity prediction, 100–111
major-minor priority junctions, 100–111
roundabouts, 100–111
signals, dispersion of stopping probability function, 219–223
Transportation
costs, and inventory, analysis of, 177–183
problem, graphical interpretation of, 37–45
simplex method, 37–45
Traveling salesman location problem, on stochastic networks, 54–57
Tree
network, maximin center of pendant vertices in, 213–216
problems, maximal direct covering, 288–299
Triangular graphs, locating point of minimum variance on, 216–219

U

Urban transit crew scheduling problem, column generation approach to, 1–13

V

Vans, fuel consumption, estimating, 46–50
Vector assignment, *p*-median problem, 139–140
Vehicle routing problem
integrated inventory allocation, 67–76
savings by split delivery routing, 141–145
with stochastic demands, properties and solution frameworks, 166–176
Vessel routing, minimal time, 266–276
